

Discussion (s) or matter (s)

The space between the Fuel grate and bottom of Fire box is sufficiently Low enough that water can immerse any charcoal on said Fuel grate

Remarks:

The Fire box has two side walls, Front wall, rear wall and bottom, you have a Fuel grate which is centered close to the bottom of Fire box you can pull the Fire box from the pit enclosure by pouring water over the burning charcoals which can immerse any on said Fuel grate completely putting the charcoals out.

"Remarks"

Other barbecue pits that you use as references are different from my invention as you can see that the firebox can be pulled out with handle from the enclosure with the charcoal rack and water in the same container. Other barbecue pits you have to remove your cooking rack and you have to let the charcoals cool-off before removing the charcoal rack. Then you have to lift your water pan from the pit. Other pits that pull-out in a draw-like fashion only contains water not the charcoal rack.
